Zenitel AlphaCom Overview

AlphaCom Intercom

The Zenitel AlphaCom intercom system is a state of the art communication platform that allows for fast and effective communication in any situation. The AlphaCom server delivers high quality HD Voice audio for outstanding clarity and intelligibility. A built-in firewall provides safety and security. A single AlphaCom server can support up to 552 devices and up to 254 of the servers can be networked together in a multi-node configuration to provide expandability. The AlphaCom server also supports video on its video-enabled devices allowing the user at the intercom master station to view the person at the intercom device. The integration with Access It! Universal.NET allows users to monitor the status of the intercom devices and automatically connect to the intercom device. An optional DVR license allows the user to view live video directly through Access It! Universal.NET. Reports can be ran to audit the events generated by the Zenitel AlphaCom system as well. The integration allows Access It! Universal.NET to seamlessly interface with the AlphaCom intercom platform.

Intercom Integration

Requires Zenitel Alphacom Intercom Server System

Optional DVR capabilities to view LIVE video only for video enabled devices

Instantly view when a call is requested, a station is connected, or a station is disconnected directly from the software.

Use the software to connect stations or automatically connect to corresponding stations.

Associate intercoms to Access It! Universal.NET workstations
